

### **Supplementary File 1. Chemical analyses of POP in cord blood serum samples**

Plasma samples (2 mL) were extracted on a Strata-X 100 m (100 mg/ 3 mL; Phenomenex; Torrance, California, USA) solid phase extraction (SPE) column. A mixture of 13C-labeled internal standards, plasma sample, formic acid and deionized water was slowly applied to the column. After drying the column with pressurized nitrogen, the sample was extracted using 3 mL of dichloromethane. The extracts (taken up in 0.5 mL hexane) were cleaned up through a column containing activated florisil (1 g) and the compounds were eluted using a mixture of hexane/dichloromethane (3:1) and dichloromethane. The solvent was evaporated, taken up in 20 L of hexane and analyzed for PCBs and organochlorine pesticides on an Agilent 6890 Network gas chromatograph (GC) coupled with an Agilent 5973 Network mass spectrometer (MS) (Agilent Technologies; Mississauga, Ontario, Canada). The GC was fitted with an Agilent 60 m DB-XLB column (0.25 mm i.d., 0.25 µm film thickness). The carrier gas was helium, and all injections were in splitless mode. The MS was operated in single ion monitoring (SIM), using negative chemical ionization (NCI) with methane (99.97 %) as the reagent gas.

**Supplementary Table 1. Characteristics of the included population (n=268) compared to the initial random sub-cohort (n=601)**

CI, confidence interval; HCH, hexachlorocyclohexane; LSmeans, least-squares means; PCB, PCB, polychlorinated biphenyl; p-p'-DDE, p-p'-dichlorodiphenyldichloroethylene.

<sup>a</sup>Adjusted for total lipid level (continuous), hemolysis (2categories), maternal age (continuous), body mass index (2 categories), educational level (3 categories), smoking status (3 categories), parity (3 categories), high blood pressure (2 categories) and sex (2 categories)

<sup>b</sup>Excluding serum with substantial hemolysis (n=16)

**Supplementary Figure 1. Restricted cubic splines between betaHCH and pp'DDE, and Insulin, and Adiponectin by newborn sex**

HCB, hexachlorobenzene; HCH, hexachlorocyclohexane; PCB, PCB, polychlorinated biphenyl; p-p'-DDE, p-p'-dichlorodiphenyldichloroethylene.

We performed restricted cubic spline regressions, using imputed persistent organic pollutants concentrations in logscale. Three knots, located at the 25th, 50th, and 75th percentiles of the exposure distribution were chosen. The reference value used to calculate the 95% CI was the minimal exposure value.

<sup>a</sup> Adjusted for total lipid (continuous), hemolysis (2 categories), maternal age (continuous), body mass index (2 categories), education (3 categories), smoking status (3 categories), parity (3 categories), high blood pressure (2 categories), and sex (2 categories)

<sup>b</sup> Excluding serum with substantial hemolysis (n=16)
