[**] This work was supported by the CNRS and the Région Alsace (grant to RGD)
Molecules that combine the properties of a transition metal with those of an appended cavity have attracted a great deal of attention.\cite{1-3} So far, research in this area has focused on four main objectives: a) the design and synthesis of systems exploiting the binding properties of a receptor unit linked to a transition metal centre, with the aim of producing catalysts that mimic an enzyme;\cite{4-8} b) the study of metal-centered reactions taking place in a confined environment thereby favouring highly regio-, stereo- and shape-selective reactions;\cite{9-13} c) the metal-assisted entrapment and recognition of ionic species;\cite{14-16} d) the construction of sensors capitalising on a electro- or photoactive metal-unit covalently attached to a close, cavity-shaped receptor.\cite{17,18}

While the coordination chemistry of many multitopic ligands giving rise to 3-D architectures such as capsules, cages, bowls and boxes has been thoroughly investigated,\cite{19-25} the use of such ligands for generating oscillatory motion about a metal metal ion has not been considered yet, although examples of transition metals moving around the periphery of such an object are known.\cite{26} Herein we show how a cavity bearing two introverted donor atoms may behave as a balance wheel swinging about a central metal unit. Our approach is based on the use of a rigid, cyclodextrin-based diphosphane characterised by a long P...P separation that results in highly unsymmetrical chelation.

Diphosphine 6 was obtained in 20% overall yield according to Scheme 1. Its synthesis began with a regioselective double capping of native \(\beta\)-cyclodextrin (\(\beta\)-CD) using the bulky dialkylating reagent 1.\cite{27} The non-alkylated hydroxyl groups were subsequently methylated with NaH/MeI, resulting in the \(ABDE\)-functionalised intermediate 2 (yield 50% !). Deprotection with HBF\(_4\), leading to tetrol 3, followed by reaction with mesyl chloride in pyridine afforded tetramesylate 4. Reaction of the latter with Li\(_2\)PPh in THF gave diphosphine 6 in ca. 70% yield beside two other, unidentified products. Work-up required the preparation of the diborane adduct 5, which was separated chromatographically. Finally, 5 was treated with HNEt\(_2\) to afford quantitatively 6. As expected, the \(^{31}\)P NMR spectrum of 6 in \(\text{C}_6\text{D}_6\) shows two very near singlets, seen at \(\delta = -15.0\) and \(-15.2\) ppm, respectively (in CDCl\(_3\) the spectrum showed but a unique peak). Prolonged standing in air of a solution of 6 in MeOH produced the di(phosphine oxide) 7, the structure of which was determined by an X-ray diffraction study (Fig. 1). In the solid state, the two P=O vectors of 7 point towards the interior of the cavity, the P...P separation being 6.91 Å. Two non-bridged glucose units are tipped towards the CD axis, reflecting some strain within the CD.

Despite the long separation between the two phosphorus atoms, diphosphine 6 turned out to be suitable for chelation. Thus, for example, reaction with [Au(tht)(thf)]PF\(_6\) (tht =
tetrahydrothiophene; THF = tetrahydrofuran) led quantitatively to complex 8. The mass spectrum of 8 showed an intense peak at \( m/z = 1717.62 \) having exactly the isotopic profile expected for \([\text{Au}^\ast]^{-}\). Furthermore, the \(^{31}\text{P}\) NMR (CD\(_2\)Cl\(_2\), 25°C) spectrum displayed an AB pattern with a \( J(PP) \) coupling constant of 326 Hz, a value which is in accord with a very large bite angle. Molecular models indicate that the bite angle is close to 160°. The good chelating properties of 6 were further

\[ \text{Scheme 1. Stepwise buildup of 6} \]
Figure 1. X-ray structure of the di(phosphine oxide) 7 (view from the secondary face). Solvent molecules have been omitted. Important distances (Å): P1-P2 6.91; O1-O2 4.32.

confirmed by its reaction with [PdCl₂(PhCN)₂], [PtCl₂(PhCN)₂], and [RhCl(CO)₂]₂ leading to the chelate complexes 9-11, respectively, in 100% yield (Scheme 2 and SI). As in 8, the corresponding large \( J(PP') \) coupling constants (see SI) reflect the large bite angle of the ligand.\[^{28,29}\]
Scheme 2. Synthesis of complexes 8-11.

As shown by a variable temperature NMR study, complex 10 displays fluxional behaviour in solution. The $^{31}$P NMR (CD$_2$Cl$_2$) spectrum of 10, measured at $-80^\circ$C, revealed the presence of two species (10a and 10b) present in a 1:1 ratio, each characterised by an ABX pattern ($^2J$(AB) = 492 and 476 Hz, respectively; $^1J$(P'Pt) coupling poorly resolved) (Fig. 2, bottom). Upon raising the temperature, the signals first broadened, then coalesced near $-15^\circ$C, and finally merged into a single ABX spectrum ($^2J$(AB) = 496 Hz, $^1J$(P'Pt) = 2510 Hz) (Fig. 2, top). The observed data are consistent with exchange between two complexes both of which contain a close to linear P–Pt–P unit. A variable temperature $^1$H NMR study was also carried out which confirmed the 1:1 stoichiometry of the equilibrating species. Both series of experiments led to a free energy of activation $\Delta G^\neq = 11.3 \pm 0.2$ kcal mol$^{-1}$. Interestingly, the low temperature $^{31}$P
NMR spectra revealed two AB patterns with a large separation between the A and B parts (ca. 12 ppm), indicating that the two P atoms of each complex are coordinated to the platinum atom with unequal strength. Note that one of the phosphorus signals appears near the midpoint between the signal of the free ligand and that of the other signal. As shown by an off-resonance $^{31}$P{$^1$H} - $^{31}$P{$^1$H} ROESY NMR experiment (SI), the "strongly" coordinated phosphorus atom of each species is in exchange with the "weakly" coordinated phosphorus atom of the other isomer.

Figure 2. $^{31}$P{$^1$H}-NMR variable temperature study of the platinum complex 10. The AB patterns of the two equilibrating species are represented by dots and squares. Filled symbols are for the A parts, open symbols for the B parts.
**Scheme 3.** Balance wheel movement of ligand 6 in complex 10 (view along the CD axis). The green arrows in the lower part indicate the orientations of the $d_{x^2-y^2}$ orbital involved in formation of the two MP bonds.

Overall, the best way to describe these findings is to consider that the $d_{x^2-y^2}$ orbital involved in formation of the M–P bonds changes its orientation in a pendular fashion so as to adopt in alternation different overlaps with each of the two convergent, but non-aligned phosphorus lone pairs. Consequently, metal binding to the two phosphorus donors is inequivalent in a given species (Scheme 3). The observed isomerisation is probably also accompanied by a slight displacement of the metal centre. Thus, being unable to form an authentic trans-complex (i.e. with a P–M–P angle of 180°), diphosphane 6 may be regarded as a frustrated chelator, which compensates the metal electron deficiency generated at one coordination site by oscillating about the complexed metal ion. We propose to term this type of bidentate ligand an os-chelating (contraction of "oscillating" and "chelating") species. It is worth mentioning here that the observed fluxionality is different from that found in complexes containing hemilabile ligands, the latter leading to intermediates in which one end is totally dissociated.\[30-33\] It should be emphasized that similar dynamics were observed for all three complexes 8, 9 and 11. Furthermore, for all four complexes investigated the $J$(PP') coupling constants persisted over the temperature range $-80^\circ C$ / $+80^\circ C$. In other words, the observed
dynamic behaviour occurs without dissociation of the M–P bonds. This phenomenon may be regarded as a variant of bond-stretch isomerism.[34,35]

Scheme 4. Exploiting the os-chelating property of 6

We anticipated that the dynamic nature of 6 in the chelate complexes would weaken the P–M bonds. In fact, treatment of 9 with [PdCl₂(PhCN)₂] led formally to insertion of a PdCl₂ fragment into one of the Pd–P bonds of 9. The resulting complex, 12, crystallised with a water molecule coordinated to one of the palladium atoms (Scheme 4, Fig. 3). It is likely that owing to its rigidity, diphosphine 6 cannot adapt to a Pd₂Cl₄(µ-Cl)₂ fragment having the usual flat or roof structure and therefore prefers to cap a Pd₂Cl₄ unit having only a single chlorido bridge. Another reaction directly related to the os-chelating behaviour of 6 is the reaction between 9 and O₂/H₂O in methanol, giving 13, seemingly formed by cleavage of one of the Pd–P bonds and its substitution by a bond to H₂O, followed by oxidation of the dissociated P atom.[36] The P...P' separation in 13 (6.6 Å)
is close to the one found in 7. We note that both complexes, 12 and 13, contain a "(phosphine)PdX₂(H₂O)" unit, thus constituting rare examples of [LL'PdX₂] complexes containing a single phosphine ligand. Overall, the coordinative properties of 6 are markedly different from those of the previously reported α-CD analogue (TRANSIP).[37]

In conclusion, using a capping methodology that relies on the use of the bulky dialkylating agent 1, we have synthesised the first large bite angle diphosphine (6) based on a β-CD backbone. Owing to the rigidity of this ligand as well as the large separation between the phosphorus atoms, 6 behaves towards transition metal ions in an unsymmetrical chelator, inducing rapid oscillation of the chelate about the coordinated metal centre. This phenomenon occurs without dissociation of the phosphorus atoms. The unprecedented chelating behaviour of 6 enables the formation of monophosphine complexes located inside a CD, thereby opening a way to the further study of organometallic catalysts operating in a confined environment.

**Experimental Section**

Full experimental details including X-ray structural data are given in the Supporting Information. CCDC-756653, 758028 and 770728 contain the supplementary crystallographic data for 7, 12 and, 13, respectively. These data can be obtained free of charge from the Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.

[36] As expected, the isomeric phosphine-phosphine oxide, *i.e.* the one in which the phosphoryl group bridges the A and B glucose units, also forms. This ligand was isolated as a chelate complex (see SI).
Graphical Abstract

A cavity-shaped diphosphane displaying *os-chelating* behaviour

Rafael Gramage-Doria, Dominique Armspach, Dominique Matt, Loic Toupet

A molecular balance wheel: transition metals form with a β-cyclodextrin-derived diphosphane chelate complexes in which a fast oscillatory motion about the metal ion takes place. The observed movement occurs without metal-phosphorus bond dissociation.

General Methods

All commercial reagents were used as supplied. Solvents were dried by conventional methods and distilled immediately prior to use. CDCl₃ was passed down a 5 cm-thick alumina column and stored under nitrogen over molecular sieves (4 Å). Routine ¹H, and ¹³C{¹H} NMR spectra were recorded on FT Bruker AVANCE 300, AVANCE 400, AVANCE 500 and AVANCE 600 instruments. ¹H NMR spectral data were referenced to residual protiated solvents [7.26 ppm for CDCl₃, 7.16 ppm for C₆D₆ and 5.32 for CD₂Cl₂], ¹³C chemical shifts are reported relative to deuterated solvents [77.0 ppm for CDCl₃, 128.06 ppm for C₆D₆ and for 54.00 CD₂Cl₂] and the ³¹P NMR data are given relative to external H₃PO₄. Mass spectra were
recorded either on a Maldi TOF spectrometer (MALDI-TOF) using α-cyano-4-hydroxycinnamic acid as matrix, or on a Bruker MicroTOF spectrometer (ESI-TOF) using CH$_2$Cl$_2$, MeCN or MeOH as the solvent. Elemental analyses were performed by the Service de Microanalyse, Institut de Chimie (UMR 7177 CNRS), Strasbourg. Melting points were determined with a Büchi 535 capillary melting-point apparatus. The dialkylating reagent 1, PtCl$_2$(PhCN)$_2$, and PdCl$_2$(PhCN)$_2$ were prepared according to described procedures. Assignment of the stereochemistry of the P atoms was made by giving arbitrarily priority to glucose units A and D over glucose units B and E, respectively. The numbering of the atoms within a glucose unit is as shown below.

1,3-bis[4-tert-butylphenyl]chloromethyl]benzene 1 (5.42 g, 7.7 mmol) was added to a solution of β-cyclodextrin (3.97 g, 3.5 mmol) and DMAP (0.51 g, 4.2 mmol) in pyridine (90 mL). The reaction mixture was stirred at 70°C for 12 h before being cooled down to room temperature. Pyridine was then removed in vacuo. Addition of water (500 mL) to the residue produced a suspension that was filtrated. The cake was dried in vacuo at 50°C for 12 h. The
colourless solid was dissolved in DMF (150 mL) and NaH (5.88 g, 147 mmol) was added carefully followed by the addition of catalytic amounts of imidazole (0.010 g, 0.15 mmol). The reaction mixture was stirred at room temperature for 1 h before being cooled at 0°C whereupon MeI (17.88 g, 7.8 mL, 126 mmol) was added dropwise at 0°C. The yellow suspension was stirred for 12 h at room temperature. MeOH (50 mL) was then added slowly to quench excess NaH. The reaction mixture was poured into water (500 mL) under stirring before being extracted with Et₂O (3 × 300 mL). The organic extract was dried (MgSO₄) and evaporated to dryness to afford a brown residue. The crude material was purified by column chromatography (SiO₂, petroleum ether/AcOEt, 80:20 to 65:35, v/v) to give the desired product 2 (4.63 g, 50%) as a colourless solid.

Rf (SiO₂, petroleum ether/AcOEt, 60:40, v/v) = 0.60; m.p. dec.; ¹H NMR (300.1 MHz, CDCl₃, 25°C): δ (assignment by COSY) = 1.17 (s, 6 H, tBu), 1.18 (s, 6 H, tBu), 1.20 (s, 6 H, tBu), 1.24 (s, 6 H, tBu), 1.27–1.29 (48 H, tBu), 2.69 (d, 1 H, ¾J₉-2,H-1 = 4.0 Hz, H-2), 2.72 (s, 3 H, OMe), 2.75 (d, 1 H, ¾J₉-2,H-1 = 3.7 Hz, H-2), 3.06 (s, 3 H, OMe), 3.26 (s, 3 H, OMe), 3.33 (s, 3 H, OMe), 3.36 (s, 3 H, OMe), 3.52 (s, 3 H, OMe), 3.56 (s, 3 H, OMe), 3.59 (s, 3 H, OMe), 3.61 (s, 3 H, OMe), 3.62 (s, 3 H, OMe), 3.63 (s, 9 H, OMe), 3.64 (s, 3 H, OMe), 3.65 (s, 3 H, OMe), 3.66 (s, 3 H, OMe), 3.67 (s, 3 H, OMe), 3.20–4.05 (38 H, H-2, H-3, H-4, H-5, H-6a⁴,D, H-6b⁵,C,E,F,G), 4.22–4.28 (3 H, H-1, H-6b⁴,D), 4.50 (d, 1 H, ¾J₉-1,H-2 = 3.5 Hz, H-1), 5.15 (d, 1 H, ¾J₉-1,H-2 = 3.4 Hz, H-1), 5.37–5.39 (2 H, H-1), 5.49–5.51 (2 H, H-1), 6.99 (t, 2 H, ¾J₁₅-H₅₄ = 6.5 Hz, H-5 of both bridging C₆H₄), 7.05–7.53 (36 H, aromatic H), 7.62 (s, 1 H, H-2 of bridging C₆H₄), 7.73 (s, 1 H, H-2 of bridging C₆H₄), ppm; ¹³C{¹H} NMR (75.5 MHz CDCl₃, 25°C): δ (assignment by HMQC) = 31.43 [×24] (Me of tBu), 34.3 [×8] (C of tBu), 57.80, 57.88, 58.06, 58.14, 58.25, 58.42, 58.80, 59.03, 59.51, 59.70, 60.60, 61.03, 61.52, 61.70, 61.75, 61.84, 61.98 (OMe), 61.68, 61.70, 62.73, 63.18 (C-6⁶,A,B,D,E), 71.09, 71.75, 72.54 (C-6⁶,C,F,G), 70.46, 70.49, 70.61, 70.76, 71.20, 71.57, 71.65 (C-5), 77.21, 78.74, 80.19, 80.54, 80.98, 81.04, 81.19, 81.27, 81.64, 81.77 [×4], 82.13, 82.23, 82.26, 82.59 [×2], 82.74 [×2], 82.86 (C-2, C-3, C-4), 85.74, 86.11, 87.51, 87.85 [OC(Ar)₂], 97.74, 98.24, 98.51, 98.63, 98.77 [×3] (C-1), 124.11 [×5], 124.33, 124.43, 124.48 [×2], 124.59, 126.29, 126.44, 126.50, 126.83, 127.28, 127.46, 128.11, 128.14, 130.52, 131.00, 131.53, 131.88, 134.37, 134.95 (o-C and m-C), 140.09, 140.20, 140.41, 140.59, 140.94, 141.59, 141.92, 142.37, 142.83, 144.58, 144.96, 145.24, 148.46, 148.52, 148.54, 148.56, 148.60, 148.66 [×2], 148.92 (ipso-C) ppm; elemental analysis (%) calcd for C₁₅₅H₂₁₂O₃₅·CH₂Cl₂ (2635.32 + 83.95): C 68.88, H 7.93, found: C 68.77, H 8.09; MS (ESI-TOF): m/z (%): 2657.38 (100) [M + Na]+.
HBF₄ (34 wt % aq, 7.5 g, 7.5 mL, 29 mmol) was added dropwise to a stirred solution of capped cyclodextrin 2 (2.55 g, 0.97 mmol) in MeCN (30 mL) at room temperature. After 30 min, NEt₃ (1.47 g, 2.0 mL) was added dropwise under stirring. Addition of water (100 mL) to the reaction mixture caused the carbinol to precipitate. The resulting suspension was filtrated and the filtrate extracted with CHCl₃ (3 × 50 mL). The combined organic extracts were washed with a saturated aqueous NaHCO₃ solution (100 mL) before being dried (MgSO₄). Removal of the solvent in vacuo gave tetrol 3 (1.32 g, 99%) as a colourless solid. \( R_f \) (SiO₂, CH₂Cl₂/MeOH, 92:8, \( v/v \)) = 0.18; m.p. 153°C; \(^1\)H NMR (300.1 MHz, CDCl₃, 25ºC): δ (assignment by COSY) = 2.61 (t, 1 H, \( J_{OH-H-6} = 6.2 \) Hz, OH), 2.68 (t, 1 H, \( J_{OH-H-6} = 5.9 \) Hz, OH), 2.78 (t, 1 H, \( J_{OH-H-6} = 6.1 \) Hz, OH), 2.96 (t, 1 H, \( J_{OH-H-6} = 5.8 \) Hz, OH), 3.17–3.22 (7 H, H-2), 3.30–4.00 (35 H, H-3, H-4, H-5, H-6) \( J_{OH-H-6} = 6.1 \) Hz, OH), 2.96 (t, 1 H, \( J_{OH-H-6} = 5.8 \) Hz, OH), 3.17–3.22 (7 H, H-2), 3.30–4.00 (35 H, H-3, H-4, H-5, H-6) 3.37 (s, 9 H, OMe-6), 3.49 (s, 9 H, OMe), 3.51 (s, 6 H, OMe), 3.52 (s, 3 H, OMe), 3.53 (s, 3 H, OMe), 3.62 (s, 3 H, OMe), 3.63 (s, 3 H, OMe), 3.64 (s, 6 H, OMe), 5.01–5.03 (2 H, H-1), 5.09 (d, 1 H, \( J_{H-1,H-2} = 3.8 \) Hz, H-1), 5.10 (d, 1 H, \( J_{H-1,H-2} = 3.8 \) Hz, H-1), 5.17 (d, 2 H, \( J_{H-1,H-2} = 3.5 \) Hz, H-1), 5.23 (d, 1 H, \( J_{H-1,H-2} = 3.8 \) Hz, H-1) ppm; \(^{13}\)C\{\(^1\)H\} NMR (75.5 MHz CDCl₃, 25 ºC): δ (assignment by HMQC) = 58.25 [\( \times 3 \)], 58.68, 58.77, 58.95, 59.00, 59.06, 59.19 [\( \times 2 \)], 61.05, 61.09, 61.25, 61.28, 61.53, 61.63, 61.78 (OMe), 61.78, 61.97 [\( \times 2 \)], 62.05 (C-6\(^{A,B,D,E}\)), 71.18, 71.32, 71.47 (C-5\(^{C,F,G}\)), 71.39, 71.54, 71.69 (C-6\(^{C,F,G}\)), 71.83, 72.03, 72.33, 72.53 (C-5\(^{A,B,D,E}\)), 78.29, 79.11 [\( \times 2 \)], 79.96, 80.44, 80.69, 81.09, 81.24, 81.41, 81.45, 81.60 [\( \times 2 \)], 81.73, 81.77 [\( \times 2 \)], 81.98 [\( \times 4 \)], 82.07, 82.14 (C-2, C-3, C-4), 98.37, 98.60, 98.70 [\( \times 2 \)], 98.85 [\( \times 2 \)], 98.92 (C-1) ppm; elemental analysis (%) calcd for C₅₉H₁₀₄O₃₅ (1373.44): C 51.60 , H 7.63 , found: C 51.68, H 7.57; MS (ESI-TOF): \( m/z \) (%): 1395.63 (100) [\( M + Na \)]⁺.
Methanesulfonyl chloride (0.34 g, 0.23 mL, 2.94 mmol) was added to a solution of tetrol 3 (0.96 g, 0.70 mmol) and DMAP (0.35 g, 2.87 mmol) in dry pyridine (30 mL) at 0ºC. The reaction mixture was stirred at room temperature for 12 h before adding water (100 mL). The solution was extracted with AcOEt (3 × 50 mL). The combined organic extracts were washed sequentially with HCl 2 M (2 × 50 mL), NaOH 2 M (2 × 50 mL) and water (50 mL) before being dried (MgSO₄). Removal of the solvent in vacuo gave pure tetramesylate 4 (1.14 g, 97%) as a colourless solid.

A solution of \( ^{n}\text{BuLi} \) in hexane (1.60 M, 1.22 mL, 1.96 mmol) was added dropwise to a stirred solution of H\(_2\)PPh (0.098 g, 0.89 mmol, 0.098 mL) in THF (16.5 mL) at –78 °C. The yellow solution was allowed to rise to room temperature over 1 h whereupon the phosphide dianion precipitated. The resulting yellow suspension was cannulated slowly, within 1 h, into a stirred solution of tetramesylate 4 (0.300 g, 0.18 mmol) in THF (25 mL). The reaction mixture was stirred for 12 h at room temperature. The solvent was then removed \textit{in vacuo} and excess of Li\(_2\)PPh was protonated with MeOH (15 mL). After removal of the solvent \textit{in vacuo}, toluene (100 mL) was added and the resulting suspension filtered over celite. Evaporation of the solvent gave a colourless residue which was dissolved in THF (10 mL) before adding a solution of BH\(_3\)·THF in THF (1.00 M, 0.9 mL, 0.9 mmol) dropwise at 0°C. After stirring for 12 h at room temperature, the solvent was removed \textit{in vacuo} and the resulting colourless residue subjected to column chromatography (dried SiO\(_2\), CH\(_2\)Cl\(_2\)/MeOH, 97:3, \( v/v \)) to afford pure 5 (0.120 g, 40%) as a colourless solid. \( R_f \) (SiO\(_2\), CH\(_2\)Cl\(_2\)/MeOH, 92:8, \( v/v \)) = 0.35; m.p. 185°C; \(^1\text{H} \text{NMR (300.1 MHz, CDCl}_3\), 25°C): \( \delta \) (assignment by COSY) = 0.89 (br s, 6 H, P-BH\(_3\)), 1.62–1.64 (4 H, H-6\( ^{a}\),H-6\( ^{b, d, e}\)), 2.89–2.91 (2 H, H-6\( ^{b, d, e}\)), 3.17 (s, 3 H, OMe), 3.22 (s, 3 H, OMe), 3.27 (s, 3 H, OMe), 3.44 (s, 3 H, OMe), 3.45 (s, 6 H, OMe), 3.45 (s, 3 H, OMe), 3.46 (s, 3 H, OMe), 3.53 (s, 6 H, OMe), 3.57 (s, 3 H, OMe), 3.59 (s, 3 H, OMe), 3.62 (s, 3 H, OMe), 3.64 (s, 6 H, OMe), 3.67 (s, 3 H, OMe), 3.67 (s, 3 H, OMe), 3.67 (s, 3 H, OMe), 3.10–4.27 (34 H, H-2, H-3, H-4, H-5\( ^{b, e}\) or \( ^{a, d}\), H-5\( ^{c, f, g}\), H-6\( ^{b, e}\) or \( ^{a, d}\), H-6\( ^{c, f, g}\)), 4.60–4.62 (2 H, H-5\( ^{a, d}\) or \( ^{b, e}\)),

Crystal structure of 7•0.5 CH$_2$Cl$_2$•0.5 C$_5$H$_{12}$: Mr = 2163.56, orthorhombic, $P2_1$2$_1$2$_1$, $a = 15.1479(3)$, $b = 15.6542(3)$, $c = 36.0599(9)$ Å, $V = 8550.8(3)$ Å$^3$, $Z = 4$, $D_X = 1.268$ mg m$^{-3}$, $\lambda$(MoK$\alpha$) = 0.71073 Å, $\mu = 0.163$ mm$^{-1}$, $F(000) = 3488$, $T = 150(1)$ K. Data were collected on an Oxford Diffraction Xcalibur Saphir 3 diffractometer (graphite MoK$\alpha$ radiation, $\lambda = 0.71073$ Å). The structure was solved with SIR-97$^3$ which revealed the non hydrogen atoms of the molecule. After anisotropic refinement, many hydrogen atoms were found with a Fourier Difference. The whole structure was refined with SHELXL97$^4$ by the full-matrix least-square techniques (use of $F$ square magnitude; x, y, z, $\beta_{ij}$ for Pd, P, Cl, C and O atoms, x, y, z in riding mode for H atoms; 988 variables and 18635 observations with $I > 2.0 \sigma(I)$; calc $w = 1/[\sigma^2 (Fo^2) + (0.0985P)^2 + 0.0000P]$ where $P = (Fo^2 + 2Fc^2)/3$. $R = 0.071$, $R_w = 0.190$ and $S_w = 0.791$, $\Delta \rho < 0.645$ eÅ$^{-3}$. The alerts level A in the checkcif are mainly due to disordered MeO groups and solvents molecules. CCDC 756653 contains the supplementary crystallographic data for this paper. Crystallographic data can be obtained free of charge at www.ccdc.cam.ac.uk/conts/retrieving.html [or from the Cambridge Crystallographic Data Centre, 12 Union Road, Cambridge CB 11EZ, UK; ax: (internat.) 44-1223/336-033; E-mail: deposit@ccdc.cam.ac.uk].

Crystal structure of 12•0.5C$_5$H$_{12}$: Mr = 1930.22, monoclinic, $P2_1$2$_1$2$_1$, $a = 13.6733(3)$, $b = 24.1680(5)$, $c = 14.1445(3)$ Å, $\beta = 109.022(2)^\circ$, $V = 4418.9(2)$ Å$^3$, $Z = 2$, $D_X = 1.451$ mg m$^{-3}$, $\lambda$(MoK$\alpha$) = 0.71073 Å, $\mu = 0.643$ mm$^{-1}$, $F(000) = 2010$, $T = 130(1)$ K. Data were collected on an Oxford Diffraction Xcalibur Saphir 3 diffractometer (graphite MoK$\alpha$ radiation, $\lambda = 0.71073$ Å). The structure was solved with SIR-97$^3$ which revealed the non hydrogen atoms of the molecule. After anisotropic refinement, many hydrogen atoms were found with a Fourier Difference. The whole structure was refined with SHELXL97$^4$ by the full-matrix least-square techniques (use of $F$ square magnitude; x, y, z, $\beta_{ij}$ for Pd, P, Cl, C and O atoms, x, y, z in riding mode for H atoms; 1010 variables and 19198 observations with $I > 2.0 \sigma(I)$; calc $w = 1/[\sigma^2 (Fo^2) + (0.0815P)^2 + 0.0000P]$ where $P = (Fo^2 + 2Fc^2)/3$. $R = 0.057$, $R_w = 0.143$ and $S_w = 0.851$, $\Delta \rho < 3.11$ eÅ$^{-3}$. CCDC 758028 contains the supplementary
crystallographic data for this paper. Crystallographic data can be obtained free of charge at [www.ccdc.cam.ac.uk/conts/retrieving.html](http://www.ccdc.cam.ac.uk/conts/retrieving.html) [or from the Cambridge Crystallographic Data Centre, 12 Union Road, Cambridge CB 11EZ, UK; ax: (internat.) 44-1223/336-033; E-mail: deposit@ccdc.cam.ac.uk].

**Crystal structure of 13•C₅H₁₂**: Mr = 1804.99, orthorhombic, P2₁2₁2₁, a = 17.6384(7), b = 19.4659(5), c = 27.2535(8) Å, V = 9357.4(5) Å³, Z = 4, Dₓ = 1.281 mg m⁻³, λ(MoKα) = 0.71073 Å, μ = 0.366 mm⁻¹, F(000) = 3816, T = 100(1) K. Data were collected on an Oxford Diffraction Xcalibur Saphir 3 diffractometer (graphite MoKα radiation, λ = 0.71073 Å). The structure was solved with SIR-97³ which revealed the non hydrogen atoms of the molecule. After anisotropic refinement, many hydrogen atoms were found with a Fourier Difference. The whole structure was refined with SHELXL97⁴ by the full-matrix least-square techniques (use of F square magnitude; x, y, z, βᵢⱼ for Pd, P, Cl, C and O atoms, x, y, z in riding mode for H atoms; 1002 variables and 20360 observations with I > 2.0 σ(I); calc w = 1/[(σ²(F₀²) + (0.0600P)² + 0.0000P)] where P = (F₀² + 2 Fc²)/3. R = 0.055, Rₛ = 0.131 and Sₘ = 0.770, Δρ < 1.608 eÅ⁻³. CCDC 770728 contains the supplementary crystallographic data for this paper.
