#### Abstract

The reactivity of positions C9 and C10 of 9- or 10bromophenanthrenes in palladium-catalyzed direct heteroarylations was investigated. A wide variety of heteroarenes such as thiazoles, (benzo)thiophenes, (benzo)furans, pyrroles, selenophenes or imidazopyridazines was successfully introduced at phenanthrene C9-position via palladium-catalyzed direct arylations, using 0.5-0.1 $\mathrm{mol} \%$ of phosphine-free $\mathrm{Pd}(\mathrm{OAc})_{2}$ catalyst. Then, C10-bromination of the 9 -heteroarylated phenanthrenes, followed by a second palladium-catalyzed direct heteroarylation gives access to symmetrical and non-symmetrical 9,10-di(heteroaryl)phenanthrenes.

## Introduction

Phenanthrene is one of the most stable fused aromatics with a high resonance energy, employed as unit for the preparation of conjugated systems with a high energy gap [1]. Among phenanthrene derivatives, those bearing heteroarenes at positions C9 and/or C10 are of considerable interest for material chemistry as they are employed as building blocks for access to compounds with photochromic,[2a,2b] molecular rotor [2c] or fluorescence properties [2d]. It is well known that phenanthrene in the presence of $N$-bromosuccinimide or bromine affords selectively 9 -bromophenanthrene in high yield, without significant formation of 9,10-dibromophenanthrene [3a,3b]; (Scheme 1). A similar reactivity was observed with other polyaromatic compounds such as a dibenzofluoranthene [3c]. Therefore, the development of simple and reliable routes, using readily accessible 9 -bromophenanthrene derivatives as building block, for access to (poly)functionalized phenanthrenes is highly desirable.

[^0]

Scheme 1. Synthesis of 9-bromophenanthrene

Currently, 9- and 10-heteroarylated phenanthrenes are generally prepared via Pd-catalyzed Suzuki or Negishi couplings [4]. However, these reactions require the preliminary preparation of an organometallic (or boron) derivative of an aryl derivative, and provide an organometallic salt (MX) as by-product. Since two decades, the Pd-catalyzed direct (poly)heteroarylation, via C-H bond activation of several polyaromatic compounds using aryl halides as aryl source has emerged as a powerful alternative method for the preparation of bi- and poly-(hetero)aryls [5,6]. Compared to the more classical Suzuki, Stille, or Negishi Pdcatalyzed reactions, [7] C-H bond functionalization reactions are often more attractive, as no prior preparation of an organometallic derivative is required, reducing the number of steps to prepare these compounds. However, so far only a few examples of Pd-catalyzed heteroarylations of 9halophenanthrenes, via the $\mathrm{C}-\mathrm{H}$ bond activation of heteroarenes, have been described [8]. Li et al. employed a mixture of $2 \mathrm{~mol} \%$ of $\mathrm{Pd}(\mathrm{OAc})_{2}$ associated to $4 \mathrm{~mol} \% \mathrm{PPh}_{3}$ for the coupling of 9 bromoanthracene with imidazo[1,2-a]pyrimidine [8a]; whereas, Gryko et al. performed this reactions in the absence of phosphine ligand [8e]. Similarly, Fagnou et al. employed a mixture of $2 \mathrm{~mol} \%$ of $\mathrm{Pd}(\mathrm{OAc})_{2}$ and $4 \mathrm{~mol} \%$ of $\mathrm{PCy}_{3}$ to promote the coupling of 9 -bromoanthracene with a thiazole derivative [8c]. In 2015, Langer et al. reported the coupling of 9 bromoanthracene with an imidazole derivative using $5 \mathrm{~mol} \%$ of $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ catalyst in the presence of 1.2 equiv. of Cul , and 0.3 equiv. of PivOH as additive and $\mathrm{K}_{2} \mathrm{CO}_{3}$ as base [8d]. A few examples of metal-catalyzed heteroarylations of phenanthrenes, proceeding via base deprotonation of (benzo)oxazoles or (benzo)thiazoles, have also been reported [9]. It should be mentioned that for all these procedures, the substrate scope was not studied in detail, as only one or two specific heteroarenes were employed. Moreover, to our knowledge, the Pd-catalyzed direct 9,10-diheteroarylation of phenanthrene has not been described yet.

Here, we wish to report on the access i) to a wide variety of 9heteroarylated phenanthrenes using Pd-catalyzed direct arylation reactions, and ii) to symmetrical and non-symmetrical 9,10-diheteroarylated phenanthrenes via successive Pdcatalyzed direct heteroarylations (Scheme 2).

## Results and Discussion

In 2003, de Vries et al. reported that, when $\mathrm{Pd}(\mathrm{OAc})_{2}$ is employed as the catalyst precursor, at elevated temperature, soluble palladium $(0)$ colloids or nanoparticles are formed, which are very efficient catalysts in the Suzuki or Heck reactions [10]. From 2008, we have reported that the coupling of aryl bromides with several heteroaromatics with a variety of aryl halides proceed nicely under the de Vries conditions [11], but we had not employed phenanthrene derivatives. First, we examined the reactivity of a set or heteroarenes for coupling with 9bromophenanthrene using our previously reported phosphinefree Pd-catalyst conditions [11]. Starting from, a slight excess of 2-isobutylthiazole (1.3 equiv.) with respect to 9bromophenanthrene, in the presence of 0.5 or $0.1 \mathrm{~mol} \%$ $\mathrm{Pd}(\mathrm{OAc})_{2}$ catalyst, KOAc as the base, and DMA as the solvent at $150^{\circ} \mathrm{C}$, the desired product 1 was obtained in $96 \%$ and $94 \%$ yields, respectively (Scheme 3). No formation of side-products was detected in the course of this reaction.

Then, the reactivity of a set of heteroarenes for reaction with 9bromophenanthrene, under the same conditions, was examined. The reaction of 4 -methylthiazoles bearing ethyl or isopropyl substituents at C2-position with 9-bromophenanthrene in the presence of $0.5 \mathrm{~mol} \% \mathrm{Pd}(\mathrm{OAc})_{2}$ catalyst gave 2 and 3 in $97 \%$ and $96 \%$ yields, respectively. In the presence of thiophene derivatives bearing pentyl, chloro, cyano or acetyl substituents at C2-position, the regioselective arylation at thienyl C5-position was observed affording 4-7 in 80-94\% yields (Scheme 3). A C2substituted thiophene derivative containing also a chlorosubstituent at C4-position was tolerated affording 8, without
cleavage of the $\mathrm{C}-\mathrm{Cl}$ bond. The mono-arylation of thiophene with 9 -bromophenanthrene was also examined. The desired product 9 could be selectively obtained in $86 \%$ yield, using 2 equiv. of this heteroarene. A thiophene derivative bearing acetal- and bromo-substituents at C2- and C4-positions gave the corresponding coupling product 10 without deprotection of the acetal unit and without cleavage of the thienyl $\mathrm{C}-\mathrm{Br}$ bond. From benzothiophene, the regioselective C2-arylation was observed affording 11 in $82 \%$ yield. Then, the reactivity of a set of furan derivatives was examined. From furan derivatives bearing methyl, nbutyl, butyryl, ester or methyl acetate substituents at C2-position, the desired (phenanthren-9-yl)furan derivatives 1216 were obtained in $81-90 \%$ yields. The reaction of 2 equiv. of 1 -methylpyrrole or selenophene with 9-bromophenanthrene, under the same reaction conditions, was also successful to afford 17 and 18 in $78 \%$ and $54 \%$ yields, respectively.

Scheme 3. Pd-catalyzed direct heteroarylations of 9-bromophenanthrenes with heteroarenes

The C3-arylation of both imidazo[1,2-a]pyridine and imidazo[1,2a]pyrimidine with 9 -bromophenanthrene, using again $0.5 \mathrm{~mol} \%$ $\mathrm{Pd}(\mathrm{OAc})_{2}$ catalyst, also proceeded with complete regioselectivity affording 19 and 20 in very high yields (Schema 4, a). The reaction is not limited to the arylation at $\alpha$-position of an heteroelement of heterocycles. For example, the coupling of $9-$ bromophenanthrene with 2 -ethylbenzofuran gave the $\beta$-arylated benzofuran derivative 21 in $83 \%$ yield; and from 3,5dimethylisoxazole, the C4-arylated compound 22 was obtained in 62\% yield (Schema 4, b).

Scheme 4. Pd-catalyzed direct heteroarylations of 9-bromophenanthrenes with imidazopyridine, imidazopyrimidine, a benzofuran and an isoxazole

In order to determine the electronic influence of heteroarene substituents on the reaction rate, a competition experiment was performed (Scheme 5). Using an equimolar mixture of furan derivatives bearing nbutyl and butyryl C2-substituents, the formation of products 12 and 13 in 55:45 ratio was observed, revealing that an electron-donating substituent on furan slightly favors the reactions.

Ratio 12:13 55:45
Scheme 5. Competition reaction for Pd-catalyzed direct heteroarylation of 9bromophenanthrene

In order to prepare symmetrical and non-symmetrical C9,C10diheteroarylated phenanthrenes, which might be useful for the preparation of photochromic compounds,[2a,2b] the reactivity of 2-ethyl-4-methyl-5-(phenanthren-9-yl)thiazole 2 with N bromosuccinimide (NBS) was studied (Scheme 6). At room temperature, a poor conversion of 2 and a low yield in the desired 10-bromophenanthrene derivative 23 was observed; whereas, the reaction performed at $50^{\circ} \mathrm{C}$ during 3 h afforded 23 in a high $93 \%$ yield. A similar yield in 24 was obtained by reaction of 3 with NBS. From 2-chloro-5-(phenanthren-9yl)thiophene 4, under the same reaction conditions, the $10-$ bromo-substituted phenanthrene $\mathbf{2 5}$ was obtained in $67 \%$ yield.

Scheme 6. Reaction of $\mathbf{2}$ and $\mathbf{4}$ with $N$-bromosuccinimide

Then, the Pd-catalyzed direct heteroarylation of 23 at $\mathrm{C} 10-$ position with 2-isobutylthiazole was investigated (Scheme 7). Our first attempt using $1 \mathrm{~mol} \% \mathrm{Pd}(\mathrm{OAc})_{2}$ catalyst afforded the target product 26 in low yield due to a poor conversion of 23. On the other hand, the use of $2 \mathrm{~mol} \%$ of the thermally more stable catalyst $\mathrm{PdCl}\left(\mathrm{C}_{3} \mathrm{H}_{5}\right)(\mathrm{dppb})$ [12] gave 26 in higher $58 \%$ yield with a good conversion of 23 . From 23 and 2 -nbutylfuran, the phenanthrene derivative 27 bearing furan and thiazole units
at C9 and C10 positions was obtained in 54\% yield. The reaction of 24 with a set of thiophenes, and with a furan derivative also provided the desired 9,10-diheteroarylated phenanthrenes $\mathbf{2 8 - 3 1}$ in $52-59 \%$ yields. Finally, the reaction of 24 with 2-isopropyl-4-methylthiazole gave access to the symmetrical $\quad 9,10$-bis(2-isopropyl-4-methylthiazol-5yl)phenanthrene 32 in $55 \%$ yield.

Scheme 7. Palladium-catalyzed direct heteroarylations of 10bromophenanthrene derivatives

Finally, the influence of an isopentyl substituent at C9-position of 10-bromophenanthrene on heteroarylation reaction was investigated (Scheme 8). 9-Bromo-10-isopentylphenanthrene 34 was prepared from 9-bromophenanthene via Suzuki coupling followed by bromination with NBS. The reaction of 34 with 2-isopropyl-4-methylylthiazole and thiophene afforded the desired C10-heteroarylated phenanthrenes bearing an isopentyl
substituent at C9 position 35 and 36 in $78 \%$ and $80 \%$ yields, respectively.

## Conclusions

In summary, we have demonstrated that using as little as 0.5 $\mathrm{mol} \%$ of $\mathrm{Pd}(\mathrm{OAc})_{2}$ as the catalyst precursor, 9bromophenanthrene can be heteroarylated at C9-position, via a $\mathrm{C}-\mathrm{H}$ bond activation of heteroarenes. A wide variety of heteroarenes such as thiazoles, (benzo)thiophenes, selenophenes, (benzo)furans, pyrroles, imidazopyridazine or isoxazoles was successfully employed, and the reaction tolerated useful functional groups on the heteroarenes such as chloro, bromo, cyano, acetyl, butyryl, methyl acetate or ester substituents. This phosphine-free catalyst procedure is environmentally and economically attractive, as 1 ) there is no need to eliminate phosphine residues at the end of the reaction, 2) this $\mathrm{C}-\mathrm{H}$ bond functionalization reaction does not no require the preparation of an organometallic derivative, reducing the number of synthetic steps and the mass of waste products, 3) the major waste of theses couplings is the relatively non-toxic $\mathrm{AcOH} / \mathrm{KBr}$ instead of metallic salts with more classical metalcatalyzed coupling reactions. Moreover, the reaction of some of the 9 -heteroarylated phenanthrenes with N -bromosuccinimide provided the 10-bromophenanthrene derivatives, which were successfully employed for access to symmetrical or nonsymmetrical 9,10-di(heteroaryl)phenanthrenes. This methodology appears to be very promising for the sustainable synthesis of 9,10 -diheteroarylated phenanthrenes, and could certainly be applied to the preparation of some heteroarylated benzoanthracenes, pyrenes, chrysenes,
phenanthrophenantrenes or even coronene derivatives which are important structures in material chemistry.

## Experimental Section

## General

All reactions were performed in Schlenk tubes under argon. Potassium acetate 99+ was used. 9-Bromophenanthrene (98\%) was purchased from Alfa. DMA (99\%) was purchased from Acros. $\mathrm{Pd}(\mathrm{OAc})_{2}$, $\left[\mathrm{Pd}\left(\mathrm{C}_{3} \mathrm{H}_{5}\right) \mathrm{Cl}\right]_{2}$, 1.4-bis(diphenylphosphino)butane ( $98 \%$ ) were purchased from Alfa Aesar. The heteroarenes and 9-bromophenanthrene were used without purification. NMR spectra were recorded on Bruker GPX ( 400 MHz ) spectrometer in $\mathrm{CDCl}_{3}$ solutions. Chemical shifts are reported in ppm relative to $\mathrm{CDCl}_{3}\left({ }^{1} \mathrm{H}: 7.26\right.$ and $\left.{ }^{13} \mathrm{C}: 77.0\right)$. Flash chromatography was performed on silica gel (230-400 mesh).

## Preparation of the $\mathrm{PdCl}\left(\mathrm{C}_{3} \mathrm{H}_{5}\right)(\mathrm{dppb})$ catalyst [12]

An oven-dried 40 mL Schlenk tube equipped with a magnetic stirring bar under argon atmosphere, was charged with $\left[\mathrm{Pd}\left(\mathrm{C}_{3} \mathrm{H}_{5}\right) \mathrm{Cl}\right]_{2}(182 \mathrm{mg}, 0.5$ mmol ) and dppb ( $426 \mathrm{mg}, 1 \mathrm{mmol}$ ). 10 mL of anhydrous dichloromethane were added, then, the solution was stirred at room temperature for twenty minutes. The solvent was removed in vacuum. The yellow powder was used without purification. ${ }^{31} \mathrm{P}$ NMR $(81 \mathrm{MHz}$, $\mathrm{CDCl}_{3}$ ) $\delta=19.3$ (s).

## General procedure for the synthesis of compounds 1-22

In a typical experiment, 9-bromophenanthrene ( $0.257 \mathrm{~g}, 1 \mathrm{mmol}$ ), the heteroarene ( 1.3 or 2 mmol ) (see schemes), KOAc ( $0.196 \mathrm{~g}, 2 \mathrm{mmol}$ ) and $\mathrm{Pd}(\mathrm{OAc})_{2}(1.1 \mathrm{mg}, 0.005 \mathrm{mmol})$ were dissolved in DMA $(4 \mathrm{~mL})$ under an argon atmosphere. The reaction mixture was stirred at $150^{\circ} \mathrm{C}$ for 16 h. Then, the solvent was evaporated and the product was purified by silica gel column chromatography.

## FULL PAPER

Successive palladium-catalyzed direct heteroarylations of 9 - and 10bromophenanthrenes provides a convenient route for access to symmetrical and non-symmetrical 9,10-di(heteroarylated) phenanthrenes. . A wide variety of heteroarenes such as thiazoles, (benzo)thiophenes, (benzo)furans, pyrroles, selenophenes or imidazopyridazines was successfully employed.
