Table S3. Associations between residential greenness (NDVI) in 100m and 300m buffers around home and lung function change over a 20-year period¹, assessed by mixed linear models. Effect estimates are expressed as change following a 0.2-increase in NDVI.

Model	FEV ₁ (mL/year)			FVC (mL/year)			FEV ₁ /FVC (%/year)		
	n	β	95% CI	n	β	95% CI	n	β	95% CI
NDVI in 100m buffer									
Minimally adjusted ²	5559	-0.47	(-1.16 to 0.22)	5559	-0.83	(-1.67 to 0.02)	5559	0.009	(-0.002 to 0.021)
Main ³	5316	-0.56	(-1.29 to 0.17)	5316	-1.05	(-1.93 to -0.16)	5316	0.011	(-0.001 to 0.023)
NDVI in 300m buffer									
Minimally adjusted ²	5559	-0.39	(-1.12 to 0.33)	5559	-1.01	(-1.89 to -1.13)	5559	0.012	(0.000 to 0.024)
Main ³	5316	-0.37	(-1.13 to 0.39)	5316	-1.08	(-2.00 to -0.17)	5316	0.014	(0.001 to 0.026)

CI – confidence interval; FEV₁ - forced expiratory volume in 1 second; FVC – forced vital capacity; NDVI – Normalized Difference Vegetation Index.

Boldface indicates p-value <0.05.

¹An interaction term between the greenness variable and age at lung function measurements captures the effect of greenness on the rate of change of lung function parameter.

² With random intercepts for subjects nested within centers, and adjusted for sample, sex, age, age squared, and height.

³ With random intercepts for subjects nested within centers, and adjusted for sample, sex, age, age squared, height, age at completion of full-time education, occupation, weight, and smoking status and lifetime pack-years smoked.

Table S4. Additional associations between residential greenness (NDVI) in a 500m buffer and lung function change over a 20-year period¹, assessed by mixed linear models. Effect estimates are expressed as change following a 0.2-increase in NDVI.

Model	FEV ₁ (mL/year)			FVC (mL/year)			FEV ₁ /FVC (%/year)		
	n	β	95% CI	n	β	95% CI	n	β	95% CI
Main with BMI ²	5316	-0.57	(-1.33 to 0.20)	5316	-1.29	(-2.22 to -0.37)	5316	0.012	(-0.001 to 0.025)
Minimally adjusted, with fixed effect for center ³	5559	-0.73	(-1.47 to -0.001)	5559	-1.42	(-2.31 to -0.53)	5559	0.011	(-0.001 to 0.023)
Main, with fixed effect for center ⁴	5316	-0.56	(-1.33 to 0.21)	5316	-1.26	(-2.19 to -0.34)	5316	0.012	(-0.001 to 0.025)

CI – confidence interval; FEV₁ - forced expiratory volume in 1 second; FVC – forced vital capacity; NDVI – Normalized Difference Vegetation Index

Boldface indicates p-value <0.05.

¹ An interaction term between the greenness variable and age at lung function measurements captures the effect of greenness on the rate of change of lung function parameter.

² With random intercepts for subjects nested within centers, and adjusted for sample, sex, age, age squared, age at completion of full-time education, occupation, BMI, and smoking status and lifetime pack-years smoked

³ With random intercepts for subjects, and adjusted for centers, sample, sex, age, age squared, and height.

⁴ With random intercepts for subjects, and adjusted for centers, sample, sex, age, age squared, height, age at completion of full-time education, occupation, weight, and smoking status and lifetime pack-years smoked

Table S5. Associations between presence of green space of at least one hectare in a 300 m buffer¹ around home and lung function change over a 20-year period², assessed by mixed linear models.

Model/type of green spaces	FEV ₁ (mL/year)			FVC (mL/year)			FEV ₁ /FVC (%/year)
